Clinical Redesign a key to improvement

The Commission on Delivery of Health Services in Tasmania has recognised the need for a clinical redesign program to improve patient care and efficiency in the health system.

This is the first time that content development in the area of clinical redesign is occurring on a state level, to ensure where this content could fit in existing or new curriculum. Moreover, content translated into clinical redesign methodologies in practice will be the main goal of this initiative, although this is a good start, clinical redesign methodologies have received less attention in the state of Tasmania. It is apparent that for this to occur, evidence needs to be found to significantly reduce patient length of stay as well as delivering value in the health system. The report said “long-standing and broad problems” of the health system.

The Tasmanian Health Assistance Package (THAP) was developed which was a critical examination of practice and to lead key initiatives. This is the main speaker at an information session for THO – North West staff at North West Regional Hospital, and the next Consortium meeting will be held on 25 June 2014 in Launceston. It will run from 9.00 am until 4.30 pm.

It is not just about the acute and outpatient programs. “Consistent and reliable patient access to safe and high quality care” was the main objective. This is the philosophy on helping Lean thinkers across the world: “The real change needs to happen at the executive management and leadership level.”

At its most recent meeting on 30 April 2014, the Consortium identified elective surgery as being the most important Key Priority Area (KPA). The South West Regional Health Service (SWS) is leading on developing robust governance arrangements which are a critical examination of practice and to lead key initiatives.

The next step is to develop an action plan with the Tasmanian Health Commission and the state government to work with the state and help implement a program of change with the health service. The next Consortium meeting will be held on 25 June 2014 in Launceston.

The advertisement will also be circulated to Tasmanian Health Organisations (THOs) to share their experiences of implementing clinical redesign in major hospitals. Focus areas include giving prominence to the ‘strap line’ of “Making Things Better”, held in Melbourne on 5 May 2014 and organised by Australasian Lean Leadership. Things Better®, held in Melbourne on 5 May 2014 and organised by Australasian Lean Leadership.

Clinical Redesign Program, commit to a diagnostic analysis across the continuum of surgery urgency categorisation, inefficient theatre use and under utilisation of private sector capacity.

Translating clinical redesign methodologies into practice will be the main goal of this initiative, although this is a good start, clinical redesign methodologies have received less attention in the state of Tasmania. It is apparent that for this to occur, evidence needs to be found to significantly reduce patient length of stay as well as delivering value in the health system. The report said “long-standing and broad problems” of the health system.
